

Turning proxy control on/off to allow access to websites and outlook to synchronise when using VPN. This may need doing after every restart.

1. Ensure you are connected to your home wifi and can do a google search successfully
2. Go to the wifi icon near the clock and select CP VPN Connection, click connect, and if asked to do so login using your windows login, if it connects you should then be able to get to shared files.
3. If this doesn't work, try this. Search for (using search in task bar) Internet Options, select this, go to connections tab, select Local Area Network (LAN) settings, UNTICK Proxy server box, ok, ok. Then try step 2 again
